

# Unit 1 Measurement

---

## Scientific Methods

The scientific method refers to a \_\_\_\_\_ approach to scientific investigation. There is \_\_\_\_\_ one process known as the scientific method.

A. \_\_\_\_\_

1. Use existing \_\_\_\_\_ and \_\_\_\_\_
2. Qualitative data relates to the \_\_\_\_\_; describes \_\_\_\_\_
  - Examples:
3. Quantitative data involves \_\_\_\_\_ – numbers with \_\_\_\_\_
  - Examples:

B. \_\_\_\_\_

1. Tentative \_\_\_\_\_ or \_\_\_\_\_ based upon observations
2. Includes \_\_\_\_\_ of results and \_\_\_\_\_
3. Two possible formats:
  - If/then statement
    - If: \_\_\_\_\_
    - \_\_\_\_\_
    - Then: \_\_\_\_\_
    - \_\_\_\_\_
    - May also include a \_\_\_\_\_ to support prediction (\_\_\_\_\_)
  - Conditional statement
    - Suggests \_\_\_\_\_
    - \_\_\_\_\_
    - Reason \_\_\_\_\_

C. \_\_\_\_\_

1. An experiment is a set of controlled \_\_\_\_\_ to test the hypothesis.

2. Only \_\_\_\_\_ variable can be changed or manipulated at a time.
  3. \_\_\_\_\_ or manipulated variable is changed by the researcher. It may be the treatment applied or the \_\_\_\_\_ and is graphed on the \_\_\_\_\_.
  4. \_\_\_\_\_ or responding variable changes in response. The value depends on the \_\_\_\_\_ variable. It represents the \_\_\_\_\_ and is graphed on the \_\_\_\_\_.
  5. A \_\_\_\_\_ is a factor that is not changed and that provides a basis or standard for \_\_\_\_\_. An experiment may have control \_\_\_\_\_ or \_\_\_\_\_.
- Control groups \_\_\_\_\_.
  - Controlled variables \_\_\_\_\_.
  - If an experiment is testing the effectiveness of a new fertilizer, what would be held constant?

**Example**

Melissa believes that turtles eating Tasty Turtle Tidbits food will become smarter and will be able to navigate a maze faster than turtles eating regular Turtle Chow. She decides to perform an experiment to test her hypothesis. She has ten turtles navigate a maze and records the time it takes for each one to make it to the end. She feeds Tasty Turtle Tidbits to five turtles and Turtle Chow to five other turtles. After one week, she puts the turtles through the maze again and records the times for each.

- 1) What was Melissa’s hypothesis?
- 2) Which fish are in the control group?
- 3) What is the independent variable?
- 4) What is the dependent variable?

\*\*\*\*\*

**Writing Activity:** *A medical research team is investigating how taking aspirin will affect the number of heart attacks in men over 50 years of age.*

The control group takes a \_\_\_\_\_ instead of aspirin. Why? \_\_\_\_\_

What are the manipulated and responding variables? \_\_\_\_\_

What other factors would need to be controlled? \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Write a possible hypothesis for this investigation. \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

In a line graph for this investigation, how would the x- and y-axes be labeled? \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

\*\*\*\*\*

D. \_\_\_\_\_

1. \_\_\_\_\_ must be placed into meaningful context.
2. Involves performing \_\_\_\_\_ and summarizing data from multiple \_\_\_\_\_.
3. Review, \_\_\_\_\_, and make sense of collected data.
4. Allows comparison of experimental results to the \_\_\_\_\_.

E. \_\_\_\_\_

1. A \_\_\_\_\_ based on information obtained through experimentation
2. Data/results will \_\_\_\_\_ or \_\_\_\_\_ the hypothesis.
3. A written conclusion \_\_\_\_\_ the results of the scientific process.

### Hypotheses, Theories, and Laws

- A. Hypothesis: supported by many \_\_\_\_\_
- B. Theory: states a broad \_\_\_\_\_ of \_\_\_\_\_ supported by many experiments over time. A theory is considered successful if it can be used to make predictions that are \_\_\_\_\_. Example:
- C. Scientific Law: describes a relationship in nature that is supported by multiple experiments with no \_\_\_\_\_. Example:

## Measurement

**Mars Climate Orbiter:** What would happen if measurements were expressed one way but interpreted in another?

### Reliability of Measurements

A. Every measurement consists of two parts: 1) a \_\_\_\_\_ followed by 2) a \_\_\_\_\_ from the measuring tool.

- A measurement can only be as \_\_\_\_\_ as the measuring tool used.
- The more \_\_\_\_\_ in a measurement, the more \_\_\_\_\_ it is.
  - Example: \_\_\_\_\_

B. All \_\_\_\_\_ possess a certain degree of \_\_\_\_\_.

C. Types of Error

1. \_\_\_\_\_ error ( \_\_\_\_\_ ) are due to mistakes in procedure by experimenter or instrument and can be \_\_\_\_\_.
2. \_\_\_\_\_ error is expected, has an \_\_\_\_\_ chance of being high or being low, and is addressed by \_\_\_\_\_.
3. \_\_\_\_\_ error or \_\_\_\_\_ occurs in the same direction (always high or always low) and is usually to \_\_\_\_\_.

D. Propagation of error: \_\_\_\_\_

- Process begins with the experimenter making the measurement with a \_\_\_\_\_.
  - \_\_\_\_\_ are indicated by markings on measuring tool.
  - Space between markings gives one \_\_\_\_\_.
- Error is inherent in making measurements due to \_\_\_\_\_ digits, and these errors subsequently affect \_\_\_\_\_.

E. The maximum possible \_\_\_\_\_ for a measuring tool is defined as \_\_\_\_\_ the smallest division marked on the tool. The uncertainty in the final digit of the measurement is assumed to be \_\_\_\_\_ (known as the \_\_\_\_\_), unless otherwise noted.

- For rulers marked only by centimeters, the uncertainty in the last digit (estimated) is \_\_\_\_\_. Therefore, the plus-or-minus amount is \_\_\_\_\_.
- For rulers with markings for millimeters in addition to centimeters, the plus-or-minus amount is \_\_\_\_\_. This ruler is \_\_\_\_\_ than the first.

|<sup>1</sup>                    |<sup>2</sup>                    |<sup>3</sup>                    |<sup>4</sup>                    cm

Ruler A:  
Marked by Centimeters

- The length of the line is \_\_\_\_\_; therefore, a known digit in the measurement is “\_\_\_\_\_”.
- The second digit must be \_\_\_\_\_ because of the absence of markings.
- The length of the line can be measured as \_\_\_\_\_ with an uncertainty of \_\_\_\_\_, meaning the length measurement ranges from \_\_\_\_\_.

|<sup>1</sup>..... |<sup>2</sup>..... |<sup>3</sup>..... |<sup>4</sup>..... cm

Ruler B:  
Marked by Millimeters

- The length of the line is \_\_\_\_\_; therefore, a known digit in the measurement is “\_\_\_\_\_”.
- The second digit is between \_\_\_\_\_; due to the millimeter markings, a second known digit in the measurement is “\_\_\_\_\_”.
- The third digit must be \_\_\_\_\_.
- The length of the line can be measured as \_\_\_\_\_ with an uncertainty of \_\_\_\_\_, meaning the length measurement ranges from \_\_\_\_\_.

## Reading Graduated Cylinders

A. To measure \_\_\_\_\_, use a graduated cylinder

- Make volume readings at \_\_\_\_\_ with the graduated cylinder on a flat surface.
- View the curve or \_\_\_\_\_.
- Read the volume at the lowest point or \_\_\_\_\_.

B. Typically, the smaller the graduated cylinder, the greater the \_\_\_\_\_.

- The markings on the cylinder give the \_\_\_\_\_ digits in the volume reading.
- Digits between markings are \_\_\_\_\_ and will be \_\_\_\_\_ the size of the smallest division.

Cylinder A

Cylinder A is marked every \_\_\_\_\_. Numbers only appear every 20 mL but the \_\_\_\_\_ divide the space evenly. The error or uncertainty is 1/10 of the 10-mL increment, making it \_\_\_\_\_.

The liquid level in this cylinder could be measured as \_\_\_\_\_, giving it a range of \_\_\_\_\_.

Cylinder B is marked every \_\_\_\_\_. The error or uncertainty is 1/10 of this increment, making it \_\_\_\_\_.

The liquid level in this cylinder could be measured as \_\_\_\_\_, giving it a range of \_\_\_\_\_.

For Cylinder C, there are \_\_\_\_\_ spaces between 20 mL and 21 mL; it is marked every \_\_\_\_\_. The error or uncertainty is 1/10 of this increment, making it \_\_\_\_\_.

The liquid level in this cylinder could be measured as \_\_\_\_\_, giving it a range of \_\_\_\_\_.

### Reading Balances

- A. Different types of balances differ in the \_\_\_\_\_ of their readings.
- B. Electronic balances display all \_\_\_\_\_ digits and one \_\_\_\_\_ digit on the read-out.
- C. Triple beam balances have beams numbered for three place values: \_\_\_\_\_.  
\_\_\_\_\_. Four beam balances have an additional beam marked for the \_\_\_\_\_ place value (one decimal place). In beam balances, the values for all beams are \_\_\_\_\_ to attain the total mass.
- D. Estimating a final digit gives measurements written to \_\_\_\_\_ decimal places for triple beam balances and \_\_\_\_\_ decimal places for four beam balances.

The hundreds digit is \_\_\_\_\_.  
 The tens digit is \_\_\_\_\_.  
 The ones digit is \_\_\_\_\_.  
 The tenths digit is \_\_\_\_\_.  
 The hundredths digit is \_\_\_\_\_.  
 \_\_\_\_\_ g

The hundreds digit is \_\_\_\_\_.  
 The tens digit is \_\_\_\_\_.  
 The ones digit is \_\_\_\_\_.  
 The tenths digit is \_\_\_\_\_.  
 The hundredths digit is \_\_\_\_\_.  
 The thousandths digit is \_\_\_\_\_.  
 \_\_\_\_\_ g

## Standards of Measurement

A. Measurement involves using a \_\_\_\_\_ to compare a specific dimension of an object to a \_\_\_\_\_.

1. Ancient Egyptians used the length of \_\_\_\_\_ as the standard of measure.
2. What are some problems with this standard? \_\_\_\_\_  
\_\_\_\_\_

B. In the 1790s, during the French revolution, the \_\_\_\_\_ was instituted as a standard system of measurement. A revision of this system began in 1948 and culminated in the publication of the \_\_\_\_\_ (or SI system) in 1960.

C. The building blocks of SI are the standard \_\_\_\_\_ for seven quantities, which are defined in terms of objects or events in the physical world, while \_\_\_\_\_ are defined by combinations of the seven base units.

1. Time: \_\_\_\_\_ (\_\_\_\_\_)
2. Length: \_\_\_\_\_ (\_\_\_\_\_)
3. Mass: \_\_\_\_\_ (\_\_\_\_\_)
4. Temperature: \_\_\_\_\_ (\_\_\_\_\_)
5. Amount of a substance: \_\_\_\_\_ (\_\_\_\_\_)
  - a. \_\_\_\_\_ items makes up one mole of that item
  - b. AKA \_\_\_\_\_ Number
6. Electric current: \_\_\_\_\_ (\_\_\_\_\_)
7. Luminous intensity: \_\_\_\_\_ (\_\_\_\_\_)

## Prefixes for SI Units

A. Prefixes are used to produce a \_\_\_\_\_ of the original unit.

1. All multiples are \_\_\_\_\_.
2. Prefixes are used with the SI \_\_\_\_\_ but are never combined. Prefixes may also be used with certain \_\_\_\_\_, which are considered acceptable for use with SI.
3. Multiples for mass are named as if the \_\_\_\_\_ is the base unit.

B. Memory aid: \_\_\_\_\_

			base unit			
1,000 or $10^3$	100 or $10^2$	10 or $10^1$	1 or $10^0$	.01 or $10^{-1}$	.001 or $10^{-2}$	.0001 or $10^{-3}$

C. \_\_\_\_\_ can be made between different prefixes, using the \_\_\_\_\_  
\_\_\_\_\_ between them.

1. Dimensional analysis: \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

2. \_\_\_\_\_ express the relationships between two units for the same quantity.

1 kg = \_\_\_\_\_ g

1 g = \_\_\_\_\_ dg

1 hg = \_\_\_\_\_ g

1 g = \_\_\_\_\_ cg

1 dag = \_\_\_\_\_ g

1 g = \_\_\_\_\_ mg

3. Short-cut conversions only work when \_\_\_\_\_.

Smaller → Larger	Larger → Smaller
_____ by 10 for each increment	_____ by 10 for each increment
Move the decimal point one place to the _____ for each increment	Move the decimal point one place to the _____ for each increment

### Short-Cut Conversion Practice

1) 10 m = \_\_\_\_\_ mm

6) 750 hs = \_\_\_\_\_ ks

2) 500 g = \_\_\_\_\_ kg

7) 0.50 kg = \_\_\_\_\_ mg

3) 75 cs = \_\_\_\_\_ s

8) 17.5 dm = \_\_\_\_\_ hm

4) 450 mg = \_\_\_\_\_ g

9) 32.5 dag = \_\_\_\_\_ g

5) 25 dm = \_\_\_\_\_ dam

10) 25 ms = \_\_\_\_\_ s

### Dimensional Analysis

A. Dimensional analysis must be used when \_\_\_\_\_.

B. Dimensional analysis uses \_\_\_\_\_, which identify the relationship between two values with different units that express the same quantity. These factors provide \_\_\_\_\_ to go from the starting point to the ending point.

- Examples:

C. Conversion factors are \_\_\_\_\_ and can be expressed as \_\_\_\_\_. Each fraction can be written in \_\_\_\_\_ and always equals a value of \_\_\_\_\_.

- Example: If you have one dozen eggs, how many eggs do you have? \_\_\_\_\_.  
Therefore, \_\_\_\_\_. Written as fractions —

D. Dimensional analysis is a problem-solving method consisting of specific steps.

1. \_\_\_\_\_: identify (underline) the unknown in problem statement.
2. \_\_\_\_\_: identify (circle) the given in the problem statement.
3. \_\_\_\_\_: provides framework to get from start to finish.
4. \_\_\_\_\_: determined by applicable conversion factors.

### Dimensional Analysis Practice

How many kilograms are in 150 lbs? What conversion factor(s) apply to this problem? \_\_\_\_\_

This conversion factor can be expressed as a fraction in two forms:

Write the \_\_\_\_\_, start with the \_\_\_\_\_, and then draw the \_\_\_\_\_ to connect the two quantities.

Use dimensional analysis to solve the following problems.

- 1) How many seconds are in 22 days?
  
  
  
  
  
  
  
  
  
  
- 2) How many inches are in 127 miles?
  
  
  
  
  
  
  
  
  
  
- 3) How many calories are in 42 joules?

## Volume

A. Volume: the \_\_\_\_\_ occupied by a sample of matter

1. Derived unit for volume: \_\_\_\_\_ (\_\_\_\_\_); \_\_\_\_\_  
(\_\_\_\_\_ or \_\_\_\_\_) is more useful in chemistry

- $1 \text{ m}^3 = \text{_____ cm}^3$

2. Some non-SI units are accepted for use with SI units; for example, the \_\_\_\_\_ (\_\_\_\_\_) is still an accepted unit for liquid volume.

- $1 \text{ L} = \text{_____}$

3. For smaller quantities of liquids, volume is measured in \_\_\_\_\_ (\_\_\_\_\_).

- $1 \text{ cm}^3 = 1 \text{ cc} = \text{_____ mL}$

- $1 \text{ dm}^3 = 1 \text{ L} = \text{_____ mL}$

C. Volume of \_\_\_\_\_ Objects: solid objects with regular dimensions

1. For square/rectangular objects,  $V = (\text{length})(\text{width})(\text{height})$

- Calculate the volume of the cube:

2. For cylinders,  $V = \pi(\text{height})(\text{radius})$ , where  $\pi = 3.14$

- Calculate the volume of the cylinder:

D. Volume of \_\_\_\_\_ Objects: solid objects with irregular shapes

1. Use the method called \_\_\_\_\_.

① Add water to a \_\_\_\_\_. Measure and record the volume.

② Add the \_\_\_\_\_ to the cylinder. Measure and record the new volume.

③ Use the initial and final volume readings to calculate the volume of the object.

- $V_{\text{object}} =$

- A toy dinosaur placed in a graduated cylinder causes the water to rise from 4.80 mL to 5.60 mL. What is the volume of the rock? \_\_\_\_\_

## Density

A. Density (D): \_\_\_\_\_

B. Formula

D =

C. Using the Density Formula

1. Find the density of aluminum if a 13.5 g sample has a volume of  $5.0 \text{ cm}^3$ .
2. Find the mass of a liquid if 10. mL have a density of  $2.1 \text{ g/mL}$ .

D. The density of water ( $\text{H}_2\text{O}$ ) is \_\_\_\_\_ or \_\_\_\_\_. Therefore, 1 mL of water has a mass of \_\_\_\_\_ g, meaning, for water, \_\_\_\_\_ (conversion factor).

- Given that the density of water can be expressed as  $1 \text{ g/cm}^3$  or  $1 \text{ g/mL}$ , what can you say about the relationship between  $\text{cm}^3$  and mL?

## Temperature

A. Temperature defined: a measure of the average \_\_\_\_\_ of particles of a substance

B. Used to compare the relative \_\_\_\_\_ of objects or substances

C. Measure with a \_\_\_\_\_

D. The Celsius scale is a \_\_\_\_\_ temperature scale based upon the freezing point (\_\_\_\_\_) and boiling point (\_\_\_\_\_) of water. The distance between these two points was divided into 100 equal units known as \_\_\_\_\_.

E. The kelvin scale is an \_\_\_\_\_ temperature scale devised by Lord Kelvin and based upon the temperature known as \_\_\_\_\_ (the lowest possible temperature where all molecular motion stops). There are no \_\_\_\_\_ temperature values on the kelvin scale.

F. Formula for conversion:

### Conversion Practice

- |                                  |   |
|----------------------------------|---|
| 1) $100^\circ\text{C} =$ _____ K | 4) $293 \text{ K} =$ _____ $^\circ\text{C}$ |
| 2) $0^\circ\text{C} =$ _____ K   | 5) $333 \text{ K} =$ _____ $^\circ\text{C}$ |
| 3) $25^\circ\text{C} =$ _____ K  | 6) $303 \text{ K} =$ _____ $^\circ\text{C}$ |
| 4) $27^\circ\text{C} =$ _____ K  | 7) $223 \text{ K} =$ _____ $^\circ\text{C}$ |

## Representing Data

- A. \_\_\_\_\_: a visual display of data that helps to reveal \_\_\_\_\_
- B. A \_\_\_\_\_ graph shows parts, often as percentages, of a fixed whole (100%).
- C. A \_\_\_\_\_ graph shows how a quantity varies with specific factors.
- D. A \_\_\_\_\_ graph, the most useful in chemistry, consists of points representing the intersection of data for two variables: the independent on the \_\_\_\_\_-axis and the dependent on the \_\_\_\_\_-axis.
1. \_\_\_\_\_ plot: points are plotted based upon the values for the independent and dependent variables
  2. \_\_\_\_\_ line: does not have to touch all data points; drawn with as many points above the line as below it
  3. Straight line indicates a \_\_\_\_\_ relationship.
    - A \_\_\_\_\_ slope (line rises to the right) indicates that the dependent variable \_\_\_\_\_ with an increase in the independent variable.
    - A \_\_\_\_\_ slope (line sinks to the right) indicates that the dependent variable \_\_\_\_\_ with an increase in the independent variable.
- E. Creating a line graph requires specific steps.
1. General guidelines: \_\_\_\_\_  
\_\_\_\_\_.
  2. Calculate the \_\_\_\_\_ for both the independent and dependent variables by taking the \_\_\_\_\_ between the highest and lowest value for each. The \_\_\_\_\_ is graphed on the longest side of the graph paper, determining whether to use the paper in the \_\_\_\_\_.
  3. Data collected for the independent variable usually appears in the \_\_\_\_\_ column of the data table and is graphed on the \_\_\_\_\_. Data for the \_\_\_\_\_ variable is in the righthand column of the data table and is graphed on the \_\_\_\_\_. Both axes should be labeled with the \_\_\_\_\_ followed by the appropriate \_\_\_\_\_ in parentheses.
  4. The \_\_\_\_\_ is the value represented by one box on the graph paper and can vary for each graph. The scale should be set as \_\_\_\_\_ as possible based upon the size of the graph paper, but it usually equals \_\_\_\_\_. Scales for the x- and y-axes do not have to be the same.

5. Mark the \_\_\_\_\_ on each axis evenly, such as every line or every other line. Both axes do not have to be marked the same, but each should be marked \_\_\_\_\_. Increments are usually marked by \_\_\_\_\_ and must make sense in terms of the \_\_\_\_\_.
6. Only one \_\_\_\_\_ (upper right) of a graph is used and should be drawn to take up as much space on the graph paper as possible. Do not extend axes below or to the left of the origin and do not draw \_\_\_\_\_. The intersection of axes (\_\_\_\_\_) is the starting point for both axes, but it does not have to be \_\_\_\_\_ and does not have to be the \_\_\_\_\_ for both axes.
7. Draw a \_\_\_\_\_ representing the intersection of the x- and y-axes for each data value in the data table. The points must remain \_\_\_\_\_ once the line is drawn but are only labeled with their \_\_\_\_\_ if the labeling does not clutter the graph.
8. Unless otherwise instructed, all lines should be drawn as \_\_\_\_\_, which may be \_\_\_\_\_. Do not draw \_\_\_\_\_ on the ends of lines.
9. The \_\_\_\_\_ of the graph should be written toward the top of the graph in any available space; do not allow the title to obscure the lines in any way. The title should use the \_\_\_\_\_ for the x- and y-axes in the format \_\_\_\_\_ to show the dependence of the dependent variable on the independent variable.

### Graphing Practice

A sample of gas was collected at 100°C and then cooled. Changes in volume were recorded in the following data table. Graph the data shown on the graph paper provided on the next page.

Temperature (°C)	Volume (mL)
100	315
80	300
60	290
40	280
30	250
20	245
10	240
0	235
-10	225
-30	200

## Reliability of Measurements

A. Accuracy:

B. Precision:

C. The \_\_\_\_\_ of experimental data must be evaluated. An \_\_\_\_\_ is the difference between an experimental value and an \_\_\_\_\_ value.

Error =

D. Percent error is a \_\_\_\_\_ of an error to an accepted value.

$$\text{Percent Error} = \frac{\text{Error}}{\text{Accepted Value}} \times 100 =$$

**Practice:** Using the data in the table below, calculate the average percent error (use average data, not trial data) for the three groups if the accepted value for density is  $1.60 \text{ g/cm}^3$ .

Density Data	Group A ( $\text{g/cm}^3$ )	Group B ( $\text{g/cm}^3$ )	Group C ( $\text{g/cm}^3$ )
<b>Trial 1</b>	1.54	1.40	1.70
<b>Trial 2</b>	1.60	1.68	1.69
<b>Trial 3</b>	1.57	1.45	1.71
<b>Average</b>	<b>1.57</b>	<b>1.51</b>	<b>1.70</b>

*Which group's data was most accurate (using averages)? Which group's data was most precise (using trial data)?*

## Significant Figures or Digits

- A. The precision of measurements is limited by the \_\_\_\_\_ and is indicated by the \_\_\_\_\_ of digits reported; these digits are known as \_\_\_\_\_ figures.
- B. Significant figures include all \_\_\_\_\_ digits plus one \_\_\_\_\_ digit.
- C. Rules for determining significant figures
1. Non-zero numbers are \_\_\_\_\_ significant.
  2. Zeros between non-zero numbers are \_\_\_\_\_ significant.
  3. All final zeros to the right of the decimal place \_\_\_\_\_ significant.
  4. Zeros that act as placeholders are \_\_\_\_\_ significant.
  5. Counting numbers and defined constants have an \_\_\_\_\_ number of significant figures.

**Practice** How many significant figures are in each of the following measurements?

- 38.15 cm \_\_\_\_\_      0.008 mm \_\_\_\_\_      50.8 mm \_\_\_\_\_  
72.050 kg \_\_\_\_\_      25,000 m \_\_\_\_\_      200. yr \_\_\_\_\_

## Calculations with Significant Figures

- A. Recall: propagation of uncertainty means \_\_\_\_\_
- \_\_\_\_\_
- B. A calculated answer cannot be more \_\_\_\_\_ than the measuring tool.
- C. A calculated answer must match the \_\_\_\_\_ precise measurement.
- D. Addition and Subtraction
- The answer has the same number of decimal places as the measurement with the \_\_\_\_\_ decimal places. For example,  $2.51 + 3.064 =$  \_\_\_\_\_.
- E. Multiplication and Division
- Round result or add zeros to the calculated answer until it has the same number of significant figures as the measurement with the \_\_\_\_\_ significant figures. For example,  $3.50/2 =$  \_\_\_\_\_.
  - Rounding is reserved for the \_\_\_\_\_; do not \_\_\_\_\_ for intermediate answers.
