

## Bohr's Energy Levels

- Electrons in \_\_\_\_\_
- \_\_\_\_\_ energy levels: \_\_\_\_\_ to \_\_\_\_\_
- \_\_\_\_\_ energy levels: \_\_\_\_\_ from \_\_\_\_\_
- Ground State: \_\_\_\_\_ in \_\_\_\_\_ possible

## Excited Atom

- Atom has \_\_\_\_\_.
- \_\_\_\_\_ state is \_\_\_\_\_.
- \_\_\_\_\_ soon \_\_\_\_\_ same amount of \_\_\_\_\_.
- \_\_\_\_\_ seen as \_\_\_\_\_.

## The Modern View of Light

- \_\_\_\_\_ has a \_\_\_\_\_.
- Light may \_\_\_\_\_ as a \_\_\_\_\_.
  - Light may \_\_\_\_\_ as a \_\_\_\_\_ of \_\_\_\_\_ called \_\_\_\_\_ or \_\_\_\_\_.

## Spectroscopy

- \_\_\_\_\_ lines represent \_\_\_\_\_ as \_\_\_\_\_ returns to \_\_\_\_\_.
- \_\_\_\_\_ lines \_\_\_\_\_ an \_\_\_\_\_.
- Called the \_\_\_\_\_ of an \_\_\_\_\_.

## Orbital

\_\_\_\_\_ of \_\_\_\_\_ where an \_\_\_\_\_ is \_\_\_\_\_ to be \_\_\_\_\_

Fill in the blanks with the most appropriate term:

In Bohr's model of the atom, electrons are in certain \_\_\_\_\_ levels, with the levels closest to the nucleus of \_\_\_\_\_ energy than those farther from the nucleus. In the \_\_\_\_\_ state of the atom, the electrons are in the lowest \_\_\_\_\_ level possible. When an atom absorbs energy, it is said to be in the \_\_\_\_\_ state, which is unstable. The atom will soon \_\_\_\_\_ the same amount of energy absorbed which may be seen as visible light. In the study of \_\_\_\_\_, this visible light is seen as the \_\_\_\_\_ spectrum of an element, which is also called an element's "fingerprints".

The modern view of light is that it has a \_\_\_\_\_ nature. In other words, light may behave as a stream of particles called \_\_\_\_\_ or \_\_\_\_\_, or light may behave as a \_\_\_\_\_. Modern scientists suggest that the nature of light depends on the experiment!

**Quantum Numbers**

- \_\_\_\_\_
- Used to \_\_\_\_\_ an \_\_\_\_\_ in an \_\_\_\_\_

***n***

- \_\_\_\_\_
- Represents \_\_\_\_\_ energy level of \_\_\_\_\_  
 \_\_\_\_\_ # of \_\_\_\_\_ in an \_\_\_\_\_  
 \_\_\_\_\_ = \_\_\_\_\_

Example: What is the maximum number of electrons that can be in the \_\_\_\_\_ main energy level?

***l***

- The \_\_\_\_\_
- Describes the \_\_\_\_\_ within an \_\_\_\_\_
- \_\_\_\_\_ of orbital \_\_\_\_\_ possible in \_\_\_\_\_  
 \_\_\_\_\_ = \_\_\_\_\_

**Orbital Shapes**

designated \_\_\_\_\_

- level 1: \_\_\_\_\_
- level 2: \_\_\_\_\_
- level 3: \_\_\_\_\_
- level 4: \_\_\_\_\_

**How many electrons can each sublevel hold?**

$s = 1 \text{ orbital} \times 2 \text{ e}^-/\text{orbital} = \underline{\hspace{2cm}} \text{ e}^-$

$p = 3 \text{ orbitals} \times 2 \text{ e}^-/\text{orbital} = \underline{\hspace{2cm}} \text{ e}^-$

$d = 5 \text{ orbitals} \times 2 \text{ e}^-/\text{orbital} = \underline{\hspace{2cm}} \text{ e}^-$

$f = 7 \text{ orbitals} \times 2 \text{ e}^-/\text{orbital} = \underline{\hspace{2cm}} \text{ e}^-$

m

- The \_\_\_\_\_
- describes \_\_\_\_\_ of \_\_\_\_\_ in \_\_\_\_\_

s

- The \_\_\_\_\_
- describes \_\_\_\_\_ of \_\_\_\_\_ in \_\_\_\_\_

**Ground State:** \_\_\_\_\_ energy arrangement of \_\_\_\_\_

Examples—

hydrogen \_\_\_\_\_ lithium \_\_\_\_\_

nitrogen \_\_\_\_\_

### Orbital Notation

Examples—

hydrogen

nitrogen

### Hund's Rule:

\_\_\_\_\_ of \_\_\_\_\_ are each \_\_\_\_\_ by one  
\_\_\_\_\_ before any \_\_\_\_\_ is occupied by a \_\_\_\_\_  
\_\_\_\_\_.

### Pauli Exclusion Principle:

No two \_\_\_\_\_ in the \_\_\_\_\_ can have the \_\_\_\_\_  
\_\_\_\_\_ of \_\_\_\_\_.

Energy Level <i>n</i>	E Sublevel (type of orbital)	# of Orbitals in Sublevel	# of e <sup>-</sup> in Sublevel	Total # of e <sup>-</sup> in E level (2 <i>n</i> <sup>2</sup> )
1				
2				
3				
4				

1. There are four types of orbitals:
- s** : shaped like a \_\_\_\_\_  
An E level can contain only \_\_\_\_\_ s orbital, making up the "s sublevel".
  - p** : shaped like \_\_\_\_\_  
An E level can contain \_\_\_\_\_ p orbitals, making up the "p sublevel".
  - d** : shaped like double dumbbells  
An E level can contain \_\_\_\_\_ d orbitals, making up the "d sublevel".
  - f** : too complex to draw or describe  
An E level can contain \_\_\_\_\_ f orbitals, making up the "f sublevel".
2. Each orbital can hold a maximum of \_\_\_\_\_ electrons. Since both electrons have a \_\_\_\_\_ charge, they \_\_\_\_\_. What keeps them from flying apart?  
*Each electron \_\_\_\_\_ on its axis. One spins \_\_\_\_\_ and the other spins \_\_\_\_\_. When charged particles spin, they act like tiny magnets. Since the two electrons spin in \_\_\_\_\_ directions, one acts like the north pole of a magnet and the other acts like the south pole. This makes the electrons \_\_\_\_\_.*
3. Since each orbital can hold \_\_\_\_\_ electrons:
- The "s sublevel" can hold \_\_\_\_\_ electrons.
  - The "p sublevel" can hold \_\_\_\_\_ electrons.
  - The "d sublevel" can hold \_\_\_\_\_ electrons.
  - The "f sublevel" can hold \_\_\_\_\_ electrons.

We use this notation to describe an electron:

How are electrons distributed within a sublevel?

*According to Hund's Rule, each \_\_\_\_\_ within a sublevel is half-filled before any is \_\_\_\_\_.*

We draw **orbital diagrams** to show the distribution of electrons in a sublevel. Circles are used to represent the individual \_\_\_\_\_. \_\_\_\_\_ are used to represent electrons in the orbital. The first electron in an orbital is represented by a  $\uparrow$  and the second by a  $\downarrow$ .

A set of four \_\_\_\_\_ numbers is assigned to each \_\_\_\_\_ to describe its energy and location within the atom. The quantum numbers use the symbols \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_.

\_\_\_\_\_ is the principle quantum number and represents the \_\_\_\_\_ level of the electron.

\_\_\_\_\_ represents the sublevel of the electron, which depends on the type of \_\_\_\_\_.

**Pauli's Exclusion Principle** states that within an atom, no two electrons can have the same set of \_\_\_\_\_. If two electrons have the same  $n$ ,  $l$ , and  $m$  numbers, they are in the same \_\_\_\_\_ level, the same \_\_\_\_\_, and the same \_\_\_\_\_. They must then have \_\_\_\_\_ spins! So, the  $s$  quantum numbers must be different.

Practice: Write electron distributions and do the orbital notation for the following:

1. P :

2. Ca:

Only do the electron distributions for the following:

1. Co:

2. Eu:

3. Tc:

**I. Fill in the blanks:**

1. The orbital shaped like a "dumb-bell" is the \_\_\_\_\_ orbital, while the orbital shaped spherically is the \_\_\_\_\_ orbital.
2. How many sublevels are present in the third main energy level? \_\_\_\_\_
3. What is the maximum number of orbitals in the "d" sublevel? \_\_\_\_\_
4. The maximum number of electrons that can occupy an orbital is \_\_\_\_\_, provided they have \_\_\_\_\_.
5. The maximum number of electrons that can occupy an energy level is represented by the formula \_\_\_\_\_.
6. The highly probable location of an electron within the atom is a(n) \_\_\_\_\_.

**II. Write the electron configuration for the following:**

1. Mg: \_\_\_\_\_
2. As: \_\_\_\_\_

**III. In the space below, show the orbital notation for Mg:**

**Nucleons-** \_\_\_\_\_ in the \_\_\_\_\_ of \_\_\_\_\_

- \_\_\_\_\_
- \_\_\_\_\_

**Atomic Number-** \_\_\_\_\_ of \_\_\_\_\_ in the \_\_\_\_\_ of an \_\_\_\_\_

**Neutral atom-** # of \_\_\_\_\_ (+) = # of \_\_\_\_\_ (-)

**Isotope-** \_\_\_\_\_ of an \_\_\_\_\_ that have \_\_\_\_\_ of \_\_\_\_\_.

**Isotopes of Hydrogen**

Hydrogen-1

- \_\_\_\_\_ proton and \_\_\_\_\_ neutrons

Hydrogen-2

- \_\_\_\_\_ proton and \_\_\_\_\_ neutrons

Hydrogen-3

- \_\_\_\_\_ proton and \_\_\_\_\_ neutrons

**Mass Number-** \_\_\_\_\_ number of \_\_\_\_\_ and \_\_\_\_\_ in an \_\_\_\_\_.

**Example:** Carbon-14 \_\_\_\_\_ Neon-20 \_\_\_\_\_

Particle	Charge	Mass	Location
Proton			
Neutron			
Electron			

**Atomic Mass-** \_\_\_\_\_ of the \_\_\_\_\_ of all the element's \_\_\_\_\_
