

# UNIT 4: The Periodic Table

---

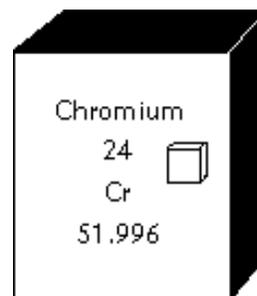

Aristotle	Circa 300 BC
Antoine Lavoisier	1770–1789
Jöns Jakob Berzelius	1828
Johann Döbereiner	1829
John Newlands	1864
Julius Lothar Meyer	1869-1870
Dmitri Mendeleev	1869-1870
William Ramsay	1894
Henry Moseley	1913
Glenn T. Seaborg	1914 1940s

**Periodic Law:**

# MODERN PERIODIC TABLE

The modern table maintains Moseley's arrangement and clearly shows periodicity, which refers to \_\_\_\_\_

\_\_\_\_\_. The periodic table consists of boxes for elements arranged in order of \_\_\_\_\_. Each box contains the element's \_\_\_\_\_ and \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_.

The \_\_\_\_ element boxes are arranged in rows called \_\_\_\_\_ and columns called \_\_\_\_\_ or \_\_\_\_\_.

- Total of seven (7) periods, numbered \_\_\_\_ through \_\_\_\_
  - ☞ Correspond to the \_\_\_\_\_
  - ☞ Referred to as \_\_\_\_\_
  - ☞ \_\_\_\_\_ in an atom determines period placement
- Two numbering systems (left to right) are in effect for the \_\_\_\_:
  1. Numbered \_\_\_\_ through \_\_\_\_.
  2. Numbered \_\_\_\_ through \_\_\_\_ followed by the letter \_\_\_\_ or \_\_\_\_.
  - ☞ Groups designated with the letter A are known as \_\_\_\_\_ elements. They display a \_\_\_\_\_.
  - ☞ Groups designated with the letter B are \_\_\_\_\_.

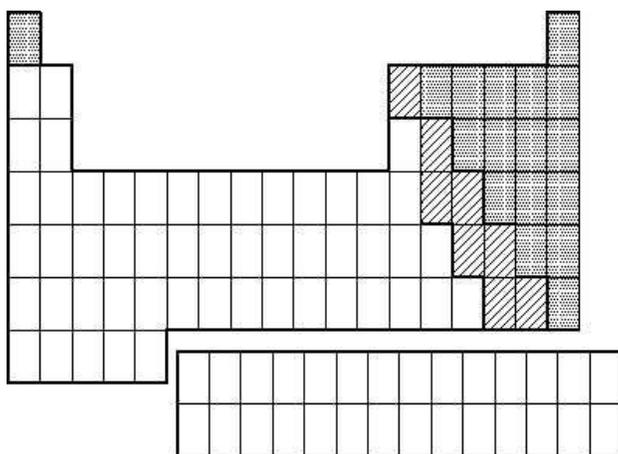

## THE s-, p-, d-, AND f-BLOCKS

The periodic table is divided into four blocks representing the \_\_\_\_\_.

1 <b>H</b> Hydrogen 1.00794																	2 <b>He</b> Helium 4.003
3 <b>Li</b> Lithium 6.941	4 <b>Be</b> Beryllium 9.012182											5 <b>B</b> Boron 10.811	6 <b>C</b> Carbon 12.0107	7 <b>N</b> Nitrogen 14.00674	8 <b>O</b> Oxygen 15.9994	9 <b>F</b> Fluorine 18.9984032	10 <b>Ne</b> Neon 20.1797

	Metals	Nonmetals	Metalloids
Characteristics	<p>◆<i>Exception:</i></p>	<p>◆<i>Exception:</i></p>	
Location on PT	<p>_____ of the stair step line Most _____ elements ◆<i>Exception:</i></p> <p>All _____ elements ◆Transition metals in ◆Inner transition metals:</p>	<p>_____ of the stair step line</p>	<p>_____ the stair step line ◆<i>Exception:</i></p>

	_____
	_____
	_____

**GROUPS OF ELEMENTS**

Group	Group Name	Group Properties	Valence e <sup>-</sup>	Oxidation Number	Block	e- Conf End
Hydrogen						
1 or 1A						
2 or 2A						
13 or 3A						
14 or 4A						
15 or 5A						
16 or 6A						
17 or 7A						
18 or 8A						
3 – 12 or B Groups	Transition Metals					
	Inner Transition Metals	♦				
	♦	♦				
		♦				

**Valence electrons:** electrons in an atom's \_\_\_\_\_  
 that determine the \_\_\_\_\_ of an element

- Atoms in the \_\_\_\_\_ have similar properties because they have \_\_\_\_\_
- \_\_\_\_\_ is indicated by the period in which element is found
- For representative elements, the last digit of the group number indicates the \_\_\_\_\_.

Element	# Valence Electrons	Energy Level of Valence Electrons	Configuration of Valence Electrons
1. Hydrogen			
2. Nitrogen			
3. Magnesium			
4. Silicon			
5. Sulfur			
6. Krypton			

**Ions**

- Neutral atoms have no overall electrical charge because \_\_\_\_\_  
 \_\_\_\_\_.
- Noble gases have stable configurations because \_\_\_\_\_  
 \_\_\_\_\_.
- Exception: \_\_\_\_\_
- Atoms gain or lose electrons to \_\_\_\_\_ by \_\_\_\_\_  
 \_\_\_\_\_.
- Such an atom is no longer neutral but \_\_\_\_\_  
 \_\_\_\_\_.
- Metals: \_\_\_\_\_
- Nonmetals: \_\_\_\_\_

 Write the electron configuration for a neutral potassium atom. Circle valence e<sup>-</sup>.

 Write the electron configuration for a potassium ion.

 Write the electron configuration for a neutral argon atom.

**OCTET RULE**

**Oxidation number** (or **state**): \_\_\_\_\_

\_\_\_\_\_. It equals the \_\_\_\_\_ when an atom forms its ion.

- Predicted by \_\_\_\_\_
- Positive when \_\_\_\_\_; negative when \_\_\_\_\_
- Written \_\_\_\_\_
- Noble gases have oxidation number of \_\_\_\_; \_\_\_\_\_  
\_\_\_\_\_.
- Elements in the carbon group have \_\_\_\_\_  
\_\_\_\_\_.

 Element Name	Element Symbol	Oxidation Number	Symbol for Ion	Configuration of Ion (noble gas configuration)
1. Hydrogen				
2. Magnesium				
3. Oxygen				
4. Aluminum				
5. Nitrogen				
6. Sodium				
7. Sulfur				
8. Calcium				
9. Chlorine				
10. Bromine				

 Practice

1. Elements #110 through #118 are the most recently discovered elements. For these elements, complete the table below.

Atomic #	Element Name	Element Symbol	Discovered in	Group	# ve <sup>-</sup>	Most closely resembles
110	Darmstadtium	Ds	1994			
111	Roentgenium	Rg	1994			
112	Copernicium	Cn	1996			
113	Ununtrium	Uut	2003			
114	Flerovium	Fl	1998			
115	Ununpentium	Uup	2004			
116	Livermorium	Lv	2000			
117	Ununseptium	Uus	2009			
118	Ununoctium	Uuo	2002			

2. Explain the term *representative elements*.

What is the primary difference between the representative elements and the transition elements? (*Think: electron configuration.*)

3. The numbers and locations of valence electrons determine the \_\_\_\_\_ of elements.
4. Oxygen is a gas. Sulfur is a solid. What is it about their electron structures that cause them to be grouped in the same chemical family?
5. Identify the element fitting each of the following descriptions:
- The metalloid in group 3A: \_\_\_\_\_
  - The halogen in period 5: \_\_\_\_\_
  - The alkali metal in period 4: \_\_\_\_\_
  - The nonmetal that is a liquid at room temperature: \_\_\_\_\_
6. Why about zinc, cadmium, and mercury cause them to be in the same chemical family?

Atoms with largest atomic radii: \_\_\_\_\_

 **Practice**

- Which has the largest atomic radius: lithium (Li), beryllium (Be), nitrogen (N), or neon (Ne)? \_\_\_\_\_ The smallest? \_\_\_\_\_
- Which has the largest atomic radius: sodium (Na), potassium (K), rubidium (Rb) or cesium (Cs)? \_\_\_\_\_ The smallest? \_\_\_\_\_
- Circle the element in each pair with the largest atomic radius.  
 Na or K      Na or Mg      O or F      Br or I      Ti or Zr
- Rank the following elements from smallest to largest atomic radius: Na, Mg, Cl, K, Rb. \_\_\_\_\_
- Which has the largest atomic radius: potassium (K) or magnesium (Mg)?
- Which has the smallest atomic radius: aluminum (Al) or barium (Ba)?

## PERIODIC TRENDS: IONIC RADIUS

Ionic radius:

When atoms form cations, they become \_\_\_\_\_. Why?

When atoms form anions, they become \_\_\_\_\_. Why?

## Practice

- Does sodium (Na) or potassium (K) have a higher first ionization energy?
- Does magnesium (Mg) or argon (Ar) have a higher first ionization energy?
- Explain why much more ionization energy is required to remove the first electron from neon than from sodium.
- Why does barium (Ba) have a lower ionization energy than beryllium (Be)?

## PERIODIC TRENDS: ELECTRONEGATIVITY

Electronegativity:

- Differences in electronegativity determine \_\_\_\_\_
- Electronegativity of \_\_\_\_\_ is not usually included

 Shade the box of the element with the *highest* electronegativity.

 Outline the box of the element with the *lowest* electronegativity.

### Practice

1. Does magnesium or aluminum have a higher electronegativity value?
2. Does nitrogen or phosphorous have a higher electronegativity value?
3. Does calcium (Ca) or bromine (Br) have a higher electronegativity value?
4. Does sodium (Na) or potassium (K) have a higher electronegativity value?
5. Which atom is more electronegative: hydrogen (H) or oxygen (O)?
6. Which atom is more electronegative: carbon (C) or chlorine (Cl)?
7. Which atom is more electronegative: magnesium (Mg) or oxygen (O)?
8. Which atom is more electronegative: sodium (Na) or chlorine (Cl)?

# PERIODIC TRENDS: REACTIVITY

Reactivity: \_\_\_\_\_

related to several factors, including \_\_\_\_\_

- Metals: more reactive if have \_\_\_\_\_

- Nonmetals: more reactive if have \_\_\_\_\_
